Subject: RM 10.9 Removal Action: Turbidity Monitoring Buoys

Jennifer and Mike,

In today's call, I want to ask if EPA will allow us to remove the Turbidity Monitoring Buoys once the placement of panels and armoring stone is completed. Just want to give you a heads up so you can think about it ahead of time. There has not been any turbidity hits related to any of our work since the beginning of the project. The silt curtains will remain in place until after the habitat layer is placed. And given the prior positive experiences with the telebelt which will be used to place the habitat layer, there is no reason to expect that there will be turbidity plumes during that work.

Looking forward to the call at 1 PM.

Stan
